

Press Release

LAUNCH OF ACCESS: THE LATEST IN THE "MADE IN COPPERNIC" PDA RANGE: AN ULTRA-SECURE TERMINAL.

Aix-en-Provence, 8 July 2020 – Coppernic, the specialists in professional mobile terminals, today announced the launch of its brand-new multi-application mobile product: **ACCESS**.

The modern, compact design in this new "made by Coppernic" PDA incorporates a very **wide range of features**. ACCESS is a elegant, attractive and user-friendly device, designed for teams working in all conditions. Equipped with a 5-inch capacitive touch screen and weighing in at a **featherweight** 270 grams (battery included), this PDA is a big hit with users for its intuitive features. Designed for sectors such as **access control** or **secure identification**, ACCESS is a robust, configurable professional terminal, equipped with powerful technological components to guarantee excellent performances: OctaCore processor @ 2.2 GHz, Android 10 operating system, integrated GPS, 1D/2D imager, etc.

What's more, it includes a **Secure Element** providing security for data captured and/or transmitted towards the Host from start to finish. The Secure Element is a processor with an internal memory and advanced cryptography features, protected against both digital and physical intrusions. The component literally self-destructs when an attempted attack is detected. **Secure Elements are today seen as impregnable**. A **SAM** (Secure Access Module) adds to the high standards in data security.

"**Pogo Pin**" connectors at the back of the terminal give owners access to a whole host of possibilities to meet professional needs (RFID UHF module, iris sensor, temperature sensor, etc.)

ACCESS is an ideal PDA for all requirements **linked to real-time identification of secure identity documents** (identity checking, border control, etc.). It provides a great response to Identity Management issues with its NFC module, facial recognition via an in-built camera and an iris recognition option using an additional sensor.

The range of technical features in the new ACCESS terminal provide effective technological answers to issues in the **mobile access control** sector: hosting and protection of sensitive data, plus compatibility with the sector's main software solutions, including perfect interfacing with the leading Security Centres on the market.
